Grade 5
D1. – Data Literacy

	Curriculum Expectations	Pages
D1.1	explain the importance of various sampling techniques for collecting a sample of data that is representative of a population	5 – 6, 49, 51, 67
D1.2	collect data, using appropriate sampling techniques as needed, to answer questions of interest about a population, and organize the data in relative-frequency tables	7 – 16, 28, 43, 45, 47, 49, 51, 63 – 64, 67
D1.3		32, 36 8, 50, 3
D1.4	representing the data in appropriate ways, including in relative-frequency tables and stacked-bar graphs, and incorporating any other relevant information that helps to tell a story about the data	19 – 20, 69 - 71
D1.5	determine the mean and the median and identify the mode(s), if any, for various data sets involving whole numbers and decimal numbers, and explain what each of these measures indicates about the data	17 – 18, 21 – 25, 29 – 30, 32, 63
D1.6	analyse different sets of data presented in various ways, including in stacked-bar graphs and in misleading graphs, by asking and answering questions about the data, challenging preconceived notions, and drawing conclusions, then make convincing arguments and informed decisions	29 – 35, 53 – 63, 65 – 66, 72 - 87

Sampling Techniques

Random Sampling
When we select people in a population randomly. Each person in the population has an equal chance to be selected. For example, using a computer generator to randomly choose people from a list.

Stratified Random Sampling
Taking a population and splitting them into groups and then random sampling the groups separately. For example, a school population could be divided into two groups: (1) students who take the bus and (2) those who don't take a bus. A survey could be given to both groups by randomly selecting 10% of the people in both groups. We can learn more information about these groups by using stratified random sampling.

Systematic Random Sampling
Systematic random sampling is when you choose a random sampling strategy before beginning a survey. For example, a sample could be chosen from an alphabetized list of names, using a starting name and then every fourth name to be randomly chosen.

PREVIEW

Part 1 Write which type of sampling technique is being used in the examples below

Example of a Sampling Technique	Sampling Technique
1) Deciding randomly to choose every 5th person in	
2) Having a computer call 10% of Ontario teachers	
3) Splitting the elementary student population into primary	
4) Using a computer to randomly email 20% of the customers of a business	
5) Deciding to hand out surveys to every 10th customer who enters a store	

Part 2 Which sampling technique would you use in the situations below

Situation	Sampling Technique
1) You want to know if more men or women prefer your pizza	
2) You have a mailing list on your computer and want to sample 10% of them	
3) You work at a store and want to survey every 10 people that come in	
4) You are trying to sample 20% of everyone in Ontario by calling them	
5) You want to sample the grade 5 and grade 6's in the schools in Toronto

Qualitative vs Quantitative Data

Quantitative data	**Qualitative data**
Data that uses numbers (measured, counted) – length, height, area, weight, time, etc.	data that uses words (categories) – choices, favourites, foods, colours, etc.

Questions ad the description of the data and circle if it is quantitative or qualitative

1) M e sale last month	Quantitative Qualitative
2) Heights of t in gr	Quantitative Qualitative
3) Favourite foods of the udent	Quantitative Qualitative
4) Rainfall in April last year	Quantitative Qualitative
5) Favourite colours of the students in your clas	Quantitative Qualitative
6) The weight of different hockey skates	Qua itative e
7) The height of the grade 5 students	itative ualitative
8) Favourite season of the students in your school	Quantitative Qualitative
9) Which town/city people live in that go to your school	Quantitative Qualitative
10) Whether or not you have a pet	Quantitative Qualitative
11) How long it took to get to school	Quantitative Qualitative

MEAN

When we calculate the mean, we are finding the average of set of numbers.

Example: Three brothers named Josh, Cameron, and Morgan went on an easter egg hunt. Josh found 6 eggs, Cameron found 4, and Morgan found 5. At the end of the hunt, their mother told them to split the eggs equally. So, they decided to put all the eggs in the middle and then divide them equally amongst themselves. They had 6 + 4 + 5 = 15 eggs and 15 ÷ 3 kids = 5 eggs each.

Josh		Morgan		Total		Josh	Cameron	Morgan
9 Candy B		7 Candy Bag	=	21 Candy Bag	=	7 Candy Bag	7 Candy Bag	7 Candy Bag

Mean = 5

Questions allo… total up the candy and then fair share it

Claire	Katie				Claire	Katie	Ashley
5 Candy Bag	3 Candy Bag	Candy Ba	=	=	_____ Candy Bag	_____ Candy Bag	_____ Candy Bag

D1.5

MEAN

Mean = the average in a set of data

Step 1: Add the numbers in the data set

Step 2: Divide the sum by the amount of numbers in the set.

Example:

Data set: 5, 3, 8, 8

Step 1: 5 + 3 + 8 + 8 = 24

2: 24 ÷ 4 = (6)

Ques' Fi mean for each data set below

, 4	2) 8, 4, 12, 4
3) 12, 6, 10, 8	) 20, 10, 30, 20
5) 23, 35, 24, 30	46
7) 12, 19, 12, 26, 31	8) 15, 8, 20, 16, 11
9) 13, 18, 17, 22, 30	10) 42, 36, 55, 23, 14

PREVIEW

MODE

Mode: The mode is the number that happens the most in a group of data. It shows what is most popular.

For example:
Thirteen Grade 5 students were asked how old they are. Their answers were:
9, 10, 10, 9, 10, 10, 9, 10, 10, 9, 9, 10, 10

- **9 years old**: 5 students
- **10 years old**: 8 students

Age	9	10
Frequency	5	8

So, the **mode** is 10 because more students are 10 than 9.
👉 If two numbers are picked the same amount, both are the mode.
👉 The **mean** is not always the mode — the one that shows up the most is!

PREVIEW

Questions

Grade 5 people were asked their age. They are listed in the data sets below. Order them in the table and write the mode(s).

Data Set	Ordered List	Mode
1) 13, 15, 11, 16, 11, 13, 11	<table><tr><td></td><td></td><td>13</td><td>15</td><td>16</td></tr><tr><td>Frequency</td><td></td><td></td><td></td><td></td></tr></table>

MEDIAN

Median: The median is the middle number in a data set.

Step 1: put numbers in order from least to greatest
Step 2: circle the number in the middle.

*** If there is an even amount of numbers in the data set, add the two numbers in the middle and divide by 2. This is the median.

Stem and Leaf Plots

A stem and leaf plot is another way to organize data so it can be better understood. The stem represents the first digit or digits, and the leaf represents the last digit.

How to create a stem and leaf plot

1. Put the numbers in order from smallest to largest.
2. Determine the stems by looking at the first number. Sometimes you will have two-digit stems.
3. Write the corresponding leaf (the last digit) under the leaf part of the table.

Question Complete the stem and leaf plots below

1) 32, 44, [illegible]

Stem	Leaf

Creating Scale

When you create a scale for your graph, you need to look at the data so you can decide what to go up by. The goal is to create a graph that will fill the graph area.

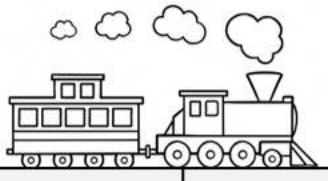

Step 1: Look at the data. Find the lowest and highest numbers.
Step 2: Count how many lines you have to plot your data.
Step 3: Decide what to go up by to ensure you have enough space to plot ALL the data.

Collecting Data - Qualitative

We collect data so that we can learn more about something we are interested in. We also collect data to solve a problem.

Examples:
Area of Interest: "What is your favourite animal?"
Solving a Problem: "Are you coming to the party on Saturday?" (this solves the problem of how many will be attending the party).

Survey Q
Area of

Collect data by asking your classmates your survey question

Survey Question
Example: Wha
favourite colour

Categories				
Tally				
Frequency				

PREVIEW

Interpreting Your Survey Results

1. How many people did you survey? _____

2. Which category was the most popular? _____

3. Which category was the least popular? _____

4. If you asked your entire school, which category do you think would win? Explain.

_____

5. Did any of the survey results surprise you?

I'm surprised that _____

Collecting Data - Quantitative

Survey Question Solving a Problem	Collect data by asking your classmates your survey question

Solve a problem in your life by asking your classmates for their opinion. For a quantitative question, the answers should be a number, or a number range.
For example: "How many books should I read a week?" –
Answer options: 0-3, 4-7, 7-10, 11+

Example
1 – "H… week should I practice my favourite sport"
2 – "… ep should I get a night?"
3 – "How many f… ables should I eat a day?"

Activity Title: Flip the Data

Objective

What are we learning about?

Students will engage in a fun and active game where they read data from a bar graph and answer questions to earn the opportunity to flip a bottle or cup. This activity combines data interpretation skills with a physical challenge, adding excitement and a competitive element to learning.

Materials

What you will need for the activity.

- B or cups g
- A sm tboard r t display bar graphs
- Timer (sto h martp pp)
- Question card on th data
- Scoreboard to ke

Instructions

How you wi mpl

1. Divide the class into small teams, ideally of 5 tude ch.
2. Prepare a series of bar graphs to display c smart d, with corresponding question cards that ask about t gr
3. One team at a time comes to the front where the gr play
4. Display the first bar graph on the smartboard.
5. The first student from the active team reads the graph and sel card. Start the timer when the question is first shown.
6. The student answers the question based on the data presented in the graph. The teacher checks the answer.
7. If the student answers correctly, they flip their bottle or cup repeatedly until they land it upright. When they do, the next teammate can take their turn.
8. If the student's answer is incorrect, they must try another question card before they can attempt to flip.
9. The team's turn ends either when all members have successfully flipped their bottle/cup or when the timer reaches a set limit (e.g., 3 minutes).
10. Record the team's time or number of successful flips on the scoreboard.
11. Repeat steps 4-10 for each team. The team with the fastest time wins.

Questions Choose a question to ask the student who is about to flip their bottle

What is the title of the graph?
What is the title of the Y-axis?
What is the title of the X-axis?
What does each bar on the graph represent?
Which category shows the highest values for both bars?
Which category has the lowest values for both bars?
How many categories are displayed on the graph?
What is the range of values shown on the Y-axis?
What is the total number of units represented by all bars?
What is the difference in value between the highest and lowest categories for both bars?
Are there any categories that have similar values? Which ones?
How does the value of one specific category compare to others?
What could be a possible reason for the highest value?
What could be a possible reason for the lowest value?
What trends can you observe from the graph?
How might this data be useful?
If you could add another category to this graph, what would it be?
How would you describe the overall distribution of data?
What insights or conclusions can you draw from this graph?
How might the information on the graph impact decisions or opinions?

Truth or Lie? Graph Edition

Objective

What are we learning about?

Students will learn to identify and explain misleading elements in graphs, developing critical thinking skills and understanding how data can be manipulated in visual representations.

Materials

What you will need for the activity.

- A[illegible]ed [illegible]al graphs (some accurate, some mi[illegible]ing)
- Smartboard [illegible] to [illegible]play the graphs
- Classroom [illegible]e [illegible]studen[illegible] and view the graphs

Instructions

How y[illegible]t comple[illegible]ctivity

1. Begin by explaining the concept of [illegible]g g[illegible] to the students, highlighting common ways graphs can be man[illegible]d (e.g. [illegible]n scales, omitting data, exaggerating differences).
2. Divide the class into small groups or pairs [illegible]ourag[illegible]sc[illegible]n among students.
3. Show each graph one at a time on the smartboard[illegible]bjector. M[illegible]re all students can see the graph clearly.
4. After showing each graph, ask the students to use finger [illegible]gnal[illegible]e decision. They show one finger if they believe the graph is true[illegible] [illegible]t misleading) and they show two fingers if they believe the graph is a l[illegible]leading in some way).
5. Once all students have made their decisions, invite a few students or groups to explain their reasoning. Ask them to point out specific elements of the graph that make it true or misleading, such as the use of a misleading scale or omitted data.
6. Facilitate a class discussion to reinforce key concepts, summarizing the points made by the students and providing additional examples if necessary.
7. Repeat steps 3-6 for each graph in the set. Encourage students to look for new elements that might be misleading as they view different graphs.
8. After all graphs have been discussed, ask the students to reflect on what they have learned. Provide them with questions to think about or answer in their math journals or as a group.

Theoretical vs Experimental Probability

Examples of Theoretical and Experimental Probability
Theoretical: You should roll a 3 once every 6 rolls = 1/6
Experimental: You rolled a 3 twice when you rolled a dice 6 times = 3/6

Part 1 Circle if the example is theoretical or experimental

Example	Theoretical or Experimental
1) If yo… a coi… …you should flip tails 25 times	Theoretical Experimental
2) You flipped a co… time… …ads 70 times	Theoretical Experimental
3) When pulling a random … f a d… …ds, you have a ¼ chance of getting a h…	Theoretical Experimental
4) You pulled a spade 5 times out of 10… pulling randomly from a deck of cards	Theoretical Experimental
5) You made 8 out of 10 free throws in your bas… game	Theoretical …mental
6) You are a 75% free throw shooter so you should make … free throws out of 100	…oreti… …er…

PREVIEW

Part 2 Is the example theoretical or experimental probability? Wi… …he fraction

Example	Theoretical or Experimental	Fraction
1) You should get a hit in baseball 1 in every 4 at bats.		
2) The Weather Network says there is a 40% chance of it raining today.		
3) You won 15 out of 25 games of hockey last season.

Theoretical vs Experimental Probability – Sock Drawer

Part 1 Write the theoretical probability of the events happening below

Your sock drawer is a mess! You have 50 socks in there in 5 different colours – white, blue, black, green, and red. Here is the breakdown of the socks in your drawer.

Colour of Sock	White	Yellow	Black	Green	Red
Number of Socks	18	8	14	4	6

1) If you [illegible] drawer 50 times without looking, what is the theoretical probability of pulling out each of the colours below.

Colour of Sock	White	Yellow	Black	Green	Red
Fraction					

PREVIEW

Part 2 Complete the experiment and record the experimental probability

2) Close your eyes and point to a random spot in the box below with your eraser. Repeat this for 50 trials and tally your results below.

W R B Y W B W W B W
B W W R B W B Y B Y G
Y B B G W Y R W B W W B W
B Y G W G W Y R R R W Y

Colour of Sock	White	Yellow	Black	Green	Red
Tally					

a) How did the experimental probability compare with the theoretical probability? Explain.

Theoretical vs Experimental Probability – # of Events

The theoretical and experimental probability of an event happening is not guaranteed to be the same. Performing more trials in an experiment will cause the experimental probability to be closer to the theoretical probability.

Example – if you flip a coin 2 times, it is easy to picture getting heads twice in a row. That would mean the experimental probability of getting a heads was 100% or 2/2. However, if you flipped the coin 100 times, it is almost impossible to get 100 heads in a row.

Part 1 ite the theoretical probability of the events happening below

cal Probability	Fraction
1) Rolling a 1 o ce	
2) Rolling a 3 on d dic	
3) Rolling a 2 or a 5 o e	
4) Rolling a 6 on a 6-sided	

Part 2 Follow the instructi low t te the experiments

1) Roll the dice 6 times. Tally your results

1	2	3	4	5	6

2) Roll the dice 60 times. Record how many of each number you get.

	1	2	3	4	5	6
Tallies						
Total						

3) Did the experimental probability get closer to the theoretical probability when you rolled the dice more times? Explain why this should happen.
