Grade 7
D1. – Data Literacy

	Curriculum Expectations	Pages That Cover the Expectations
D1.1	explain why percentages are used to represent the distribution of a variable for a population or sample in large sets of data, and provide examples	5 - 7
D1.2	collect qualitative data and discrete and continuous quantitative data to answer questions of interest, and organize the sets of data as	8 – 18, 50 – 51, 53 – 55, 68, 71, 76, 85, 87
D1.3		9, 52, 82 – 3
D1.4	create an infographic about a data set, representing the data in appropriate ways, including in tables and circle graphs, and incorporating any other relevant information that helps to tell a story about the data	95 - 100
D1.5	determine the impact of adding or removing data from a data set on a measure of central tendency, and describe how these changes alter the shape and distribution of the data	19 – 39
D1.6	analyse different sets of data presented in various ways, including in circle graphs and in misleading graphs, by asking and answering questions about the data, challenging preconceived notions, and drawing conclusions, then make convincing arguments and informed decisions	43 – 47, 57 – 67, 70, 73 – 75, 78 – 81, 101 - 118

Representing Distribution Using Percentages

Why Use Percentages?

Percentages are used to show the distribution of a variable. Using percentages makes the data easier to read than simply just using the frequency.

For example: Which table is easier to draw conclusions from?

Ways I Get To Work	
Persona[illegible]icle	3558
[illegible]	241

Relative Frequency Distribution

Frequency Tables Versus Relative Frequency Tables

A **relative frequency table** displays the percent of each option in a data set. These relative frequencies are calculated by dividing the frequencies for each option by the total number of frequencies for all options.

A **frequency table** only lists the frequencies belonging to each group. Frequency tables are harder to generate comparisons between options in a data set.

Questions the tables. Is the table a frequency table or relative frequency table?

Collecting Data - Sampling a Population

What is a Population?

A **population** is the total set of subjects that fit a particular description. For example, students in Ontario is a population and would include all the students in Ontario.

Sampling a Population

When we want to know something about a population, it is easier to ask a sample of the population versus asking everyone within that population. For example, if we wanted to know if the stude in Ontario preferred Geography or Science, we could ask 10% of the population instead of udent in Ontario. We can assume that the remaining 90% of the population would hav the same way.

Sa ion saves us a lot of time and money. It works well if we samp tly. If we went to a Science and Technology school in Ontario asked liked Geography or Science better, they would likely all say Science a b mple of the population.

PREVIEW

Questions Write a samp th ld not be a good representation of the population

	Population	ey	Bad Sample
1)	Pet Owners in Canada	What is t pet?	Dog owners in Quebec
2)	Drivers in Ontario	Which is the best ty vehicle – truck or ca	
3)	Adults in Ontario	Which genre of music is the best?	
4)	Adults in Ontario	Which is better - a hot tub or a pool?	
5)	Teens in Ontario	Which fast food restaurant is the best?	
6)	Kids in Canada	Which food is better – burgers or pizza?	
7)	Grade 7 Students in Ontario	Which school is the best in Ontario?	
8)	Athletes in Ontario	Which sport is the best?	
9)	Teachers in Ontario	Which grade is the best to teach?	
10)	Parents in Canada	Which vehicle is better – SUV or Van?

Sampling Techniques

Random Sampling
When we select people in a population randomly. Each person in the population has an equal chance to be selected. For example, using a computer generator to randomly choose people from a list.

Stratified Random Sampling
Taking a population and splitting them into groups and then random sampling the groups separately. For example, a school population could be divided into two groups: (1) students who take the bus and (2) those who don't take a bus. A survey could be given to both groups by randomly selecting 10% of the people in both groups. We can learn more information about both groups by using stratified random sampling.

Systematic Random Sampling
Systematic random sampling is when you choose a random sampling strategy before beginning a survey. For example, a sample could be chosen from an alphabetized list of names, using a starting name and then every fourth name to be randomly chosen.

PREVIEW

Part 1 Write which type of sampling technique being used in the examples below

Example of a Sampling Technique	Sampling Technique
1) Deciding randomly to choose every 5th person who will walk by	
2) Having a computer call 1% of the customers of your business	
3) Handing out surveys to every 10th person who enters your store	
4) Using a computer to randomly email 5% of the customers on your business	
5) Asking every other grade 1 and every other grade 2 in Mr. Wilson's class	

Part 2 Which sampling technique would you use in the situations below

Situation	Sampling Technique
1) You want to know if more adults or kids in your city like your pizza	
2) You want to find out what 1% of Ontario adults think about your business	
3) You are interested in which subject your classmates like the best	
4) You want to know which teacher is most popular at your school	
5) You are interested in polling 5% of your customer base, asking what their favourite product is.

Discrete or Continuous Data?

Discrete and continuous data are both forms of quantitative data. This means both are numerical, meaning the data is acquired through counting or measuring.

Discrete data is collected when the answers to a survey are only numbers. It is quantitative data that has no relationship between the numbers. For example, "how many pets you have" is discrete data because there is no relationship between 1 and 2 pets. You cannot have 1 and a half pets, only 1 or 2. Discrete data is counted.

With **continuous data**, there is a relationship between the numbers. For example, "how much rain fell there was last week?" You can have 1 and a half millimetres of rain, which means there is a relationship between 1 and 2. Continuous data is measured.

PREVIEW

Question: Will the data from the research question be discrete or continuous?

Tip: Ask yourself if you can split the answer in half.

Research Question	Discrete/Continuous
1. How many cm of snowfall were in	
2. How many siblings do you have?	
3. What was the average temperature in July?	
4. How many minutes did you read this week?	
5. How many video games do you own?	
6. How many kilometres did you run this week?	
7. How many sports do you play?	
8. What grade are you in?	
9. How many litres of milk do you drink a week?	
10. How many cars does your family have?

Data – Qualitative, Discrete, or Continuous?

Part 1 Researching a basketball team

You are the manager of a basketball team and are researching your next opponent. You decide to collect data based on the questions below. Is the data qualitative, discrete, or continuous?

Data Collected	Qualitative/Discrete/ Continuous
1) How many players are on the team?	
2) How tall are their players?	
3) How many points do they score per game?	
4) What colour are their jerseys?	
5) Which teams have they played before?	
6) How many games have they played?	
7) How old are their players?	
8) How many wins do they have this year?	
9) How many seconds do they take before they shoot?	
10) Which type of defense do they play – zone or man?	
11) How many three pointers do they take a game?	
12) What is the name of their mascot?

MEAN

When we calculate the mean, we are finding the average of a set of numbers.

Example: Three brothers named Josh, Cameron, and Morgan went 'trick or treating' on Halloween. Josh got 13 candies, Cameron got 11, and Morgan got 9. At the end of the night, their mother told them to split the candy equally. So, they decided to put all the candy in the middle and then divide them equally amongst themselves.

- They had 13 + 11 + 9 = 33 candies and divided 33 ÷ 3 kids = 11 candies each.

Josh	Cameron	Morgan		Total		Josh	Cameron	Morgan
13 Candy Bag		9 Candy Bag	=	33 Candy Bag	=	11 Candy Bag	11 Candy Bag	11 Candy Bag

Mean = 11

Estimating the Mean

The mean is the average number in a data set. When we understand what the mean of a data set is, we can estimate the mean easily without doing any calculations.

For example, in the data set: 22, 18, 16, 25, 20, we can estimate that the mean will be approximately 20, without doing any calculations. This is because the mean has to be between 16 and 25. We can also see that there are two numbers above 20, and two numbers below 20.

Part 1 1 ...ate the mean by circling one of the options ...r answer by calculating the mean

	Da...t	Options			
		1	2	3	4
1)	5, 5, 7, 7, 6	4	5	6	7
2)	22, 25, 24, 23, 26	22	23	24	25
3)	13, 18, 16, 14, 19	14	16	18	19
4)	22, 19, 25, 15, 14	16	25	23	19
5)	64, 68, 57, 59, 62		66	67	62
6)	74, 88, 65, 81, 62			82	64
7)	83, 99, 72, 76, 85			78	89
8)	93, 95, 85, 105, 87				93
9)	121, 102, 133, 125, 144	108			134
10)	152, 168, 158, 148, 134	152	16	145	139

PREVIEW

Part 2 Answer the word problems below by estimating

1) Meredith bought lunch every day from Monday to Friday last week. She spent: $9, $5, $11, $12, and $8. Approximately how much did lunch cost her per day?

2) Michelle sells popcorn at a festival. She worked for 6 hours, selling the following dollar amounts each hour: $22, $32, $45, $27, $38, and $46. Approximately how much did she earn each hour?

Finding Missing Data Point Using Mean

We can determine the missing number in a series if we know the mean by using the following formula:

$$Mean = \frac{Sum\ of\ given\ numbers + x\ (unknown\ number)}{total\ numbers}$$

Example: 25, 27, ?, 30 Mean = 26

Steps

1) Multi… number of total numbers you have by the mean (26 x 4 = 104)
2) Add … bers you know (25 + 27 + 30 = 82)
3) Fin… …(subtract) between 104 and 82 (104 – 82 = 22) – Answer = 22

PREVIEW

Questions … abl… low to find the missing data point

	Data Set		Calculations	Missing Data Point
Ex)	9, 16, ?, 22, 12, 19	15	1) …0 2) …6 + 2… + 19 = 78 3) …0 – 78	12
1)	12, 18, 6, ?, 15	17		
2)	48, ?, 32, 45, 30, 21	32		
3)	61, 35, 51, 23, ?	45

Task Cards: Mean Detective

Objective

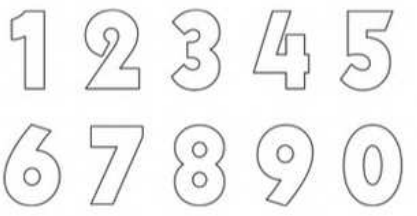

What are we learning about?

To help students understand and solve for a missing data point in a set by using the mean (average).

Materials

What you will need for the activity.

- 2
- Se e shee for answers
- Pencils

Instructions

How o activity

1. Introduce the concepts cov d in
2. Organize the students into pairs an ovide ea their sets of task cards.
3. Give each pair an answer recording sheet dow ses.
4. Encourage teamwork by having students collabora eir p on finding solutions.
5. Allow students to select any task card to begin with, emphasiz n complete the cards in any order they prefer.
6. Instruct students to record the letter of their chosen answer (A, B, or C) on their answer sheet beside the task card's number.
7. Consider using a timer to create a dynamic challenge, adjusting the duration to fit the lesson's objectives and complexity.
8. After the activity, review the answers collectively, discussing any challenging questions and strategies used to solve them.
9. Have students reflect on the activity, sharing the methods they applied and obstacles they overcame.

Outliers in Data Sets

An **outlier** in a data set are values that are significantly different from other measures. They may mean that something has gone wrong in the data collection, or they may represent a valid measure that needs further explanation.

Part 1 — Circle any outliers in the data sets below

1)	7, 8, 9, 5, 10, 42, 9	5)	1524, 1531, 1585, 1563, 1284
2)	12, 1, 9, 84, 25, 72	6)	102.2, 10.5, 103.9, 104.6, 102.5, 62.1
3)	105	7)	2751, 2853, 2623, 3547, 2345, 1258
4)	5.0, 6	8)	421, 521, 605, 2021, 4452, 506, 572

PREVIEW

Part 2 — r the below

1) Jonah practiced his 40 day. to the stop watches that automatically record his times on a comput me were: 55, 49, 51, 52, 132, and 48.

a) Which of his scores was an outlier?

b) What might have caused the outlier ore?

2) Alex looked at how many steps he took last wee h of st took over the last 7 days is recorded below:

10425, 12325, 8542, 9875, 2012, 192 20

a) Which of the values are outliers?

b) Explain why he may have an outlier of 2012 steps?

c) Why might Alex have an outlier of 19252 steps?

3) Kylie has a business where she sells cakes. She recorded her last 15 days of cake sales.

8, 7, 9, 12, 6, 25, 7, 9, 8, 6, 10, 0, 11, 12, 8

a) Which of the values are outliers?

b) Explain what could have led to her selling 25 cakes on day 6.

c) Explain what could have led to her selling 0 cakes on day 11.

Calculating Mean - Outliers

Outliers have a big impact on the mean of a data set. For example, if John records his last 5 long jumps and jumps the following distances:

6.5m, 6.8m, 1.5m, 6.2m, 6.1m

John explains after that on his third jump, he slipped and didn't perform a full jump. The data set has an outlier that doesn't reflect John's ability to jump. We can see th[illegible]fference when we use an outlier in our calculation of the mean

Mean Wi[illegible] [illegible]m
Mean[illegible]

PREVIEW

Part 1

[illegible]using the outlier and without the outlier

	Data Se[illegible]	[illegible]h Outlier(s)	Mean Without Outlier(s)
1)	9, 7, 5, 25, 8, 6		
2)	21, 48, 24, 20, 26, 22		
3)	12.2, 15.6, 14.3, 28.4, 16.1		
4)	53, 105, 61, 11, 65, 58, 59		
5)	51, 81, 84, 83, 82, 84, 113		

Part 2

Answer the word problem below

1) Explain what happened in questions 4 and 5. Why was the mean simila[illegible]n with the outliers?

2) Marla's teacher is deciding between an A- and B+. An A- is between 80-84 and a B+ is between 77-79. Marla received the following marks:

78, 85, 81, 82, 77, 88, 52, 84

Should the teacher give Marla an A- or B+? Explain using outliers – do calculations!

MODE

Mode: The number that occurs the most in a data set. The mode is used to calculate data in nominal data sets.

Step 1: Order the numbers from least to greatest
Step 2: Find the number or numbers that show up the most – You can have zero mode or more than one mode.

Example: 5, 3, 7, 3, 9, 11
5, 7, 9, 11 **Answer:** 3

PREVIEW

	Ordered List	Mode
1) 13, 15, 11		
2) 22, 25, 23, 22, 38		
3) 37, 49, 35, 37, 49, 35, 4		
4) 65, 54, 58, 58, 54, 65, 54, 58		
5) 79, 72, 75, 76, 72, 79, 75, 79		
6) 91, 95, 94, 90, 91, 94, 95, 97		
7) 121, 102, 112, 114, 104, 117		

1) Justin tracks what time he goes to bed at for 15 days. His bedtimes are written below:

7, 11, 8, 8, 7, 9, 10, 10, 7, 8, 9, 9, 8, 11, 9

What time did Justin go to bed at most often in the 15 days? _____

2) Adults were asked to choose a number from the food menu. The results are represented in the data set. What is the mode?

4, 1, 2, 4, 2, 2, 4, 1, 2, 1, 4, 2, 3, 1, 2, 2, 3, 2, 3, 4, 1, 2, 3, 1, 2, 2, 1, 3, 3, 4, 1

1	Fish
2	Chicken
3	Steak
4	Vegetables

When To Use – Mean, Median, Mode

In general, we can use the following rules when deciding which measure of central tendency to use.

Mean

- Data without outliers or data sets with many data points to "wash out" outliers
- Provides accurate average of a data set and works well with all sizes of data sets

Mode

- Working with qualitative or nominal data
- Very ea[illegible]o determine the mode and is not impacted by outliers
- Does n[illegible]s give an accurate average of a data set

Median

- Wor[illegible]hat has outliers and with large data sets
- [illegible]accurate average than mode, but less than mean

PREVIEW

Questions

[illegible]easur[illegible]tral tendency will you choose to use? Explain

1) The average points [illegible] each a[illegible]n your team. You have a large data set with no outliers.

2) People vote on their favourite number from 1[illegible], 7, 5, 6, 4, 2, 5, 7, 5

3) The average salaries for Canadians. Your data set has many outlier[illegible]

4) The average amount of medicine that is effective. The data set is small with no outliers.

5) People choose which meal number (1-6) they order from a fast-food restaurant.

Activity Title: Flip the Data

Objective

What are we learning about?

Students will engage in a fun and active game where they read data from a bar graph and answer questions to earn the opportunity to flip a bottle or cup. This activity combines data interpretation skills with a physical challenge, adding excitement and a competitive element to learning.

Materials

What you will need for the activity.

- B or cups g
- A sm tboard r t display bar graphs
- Timer (sto h martp pp)
- Question card on th data
- Scoreboard to ke

Instructions

How you wi mpl

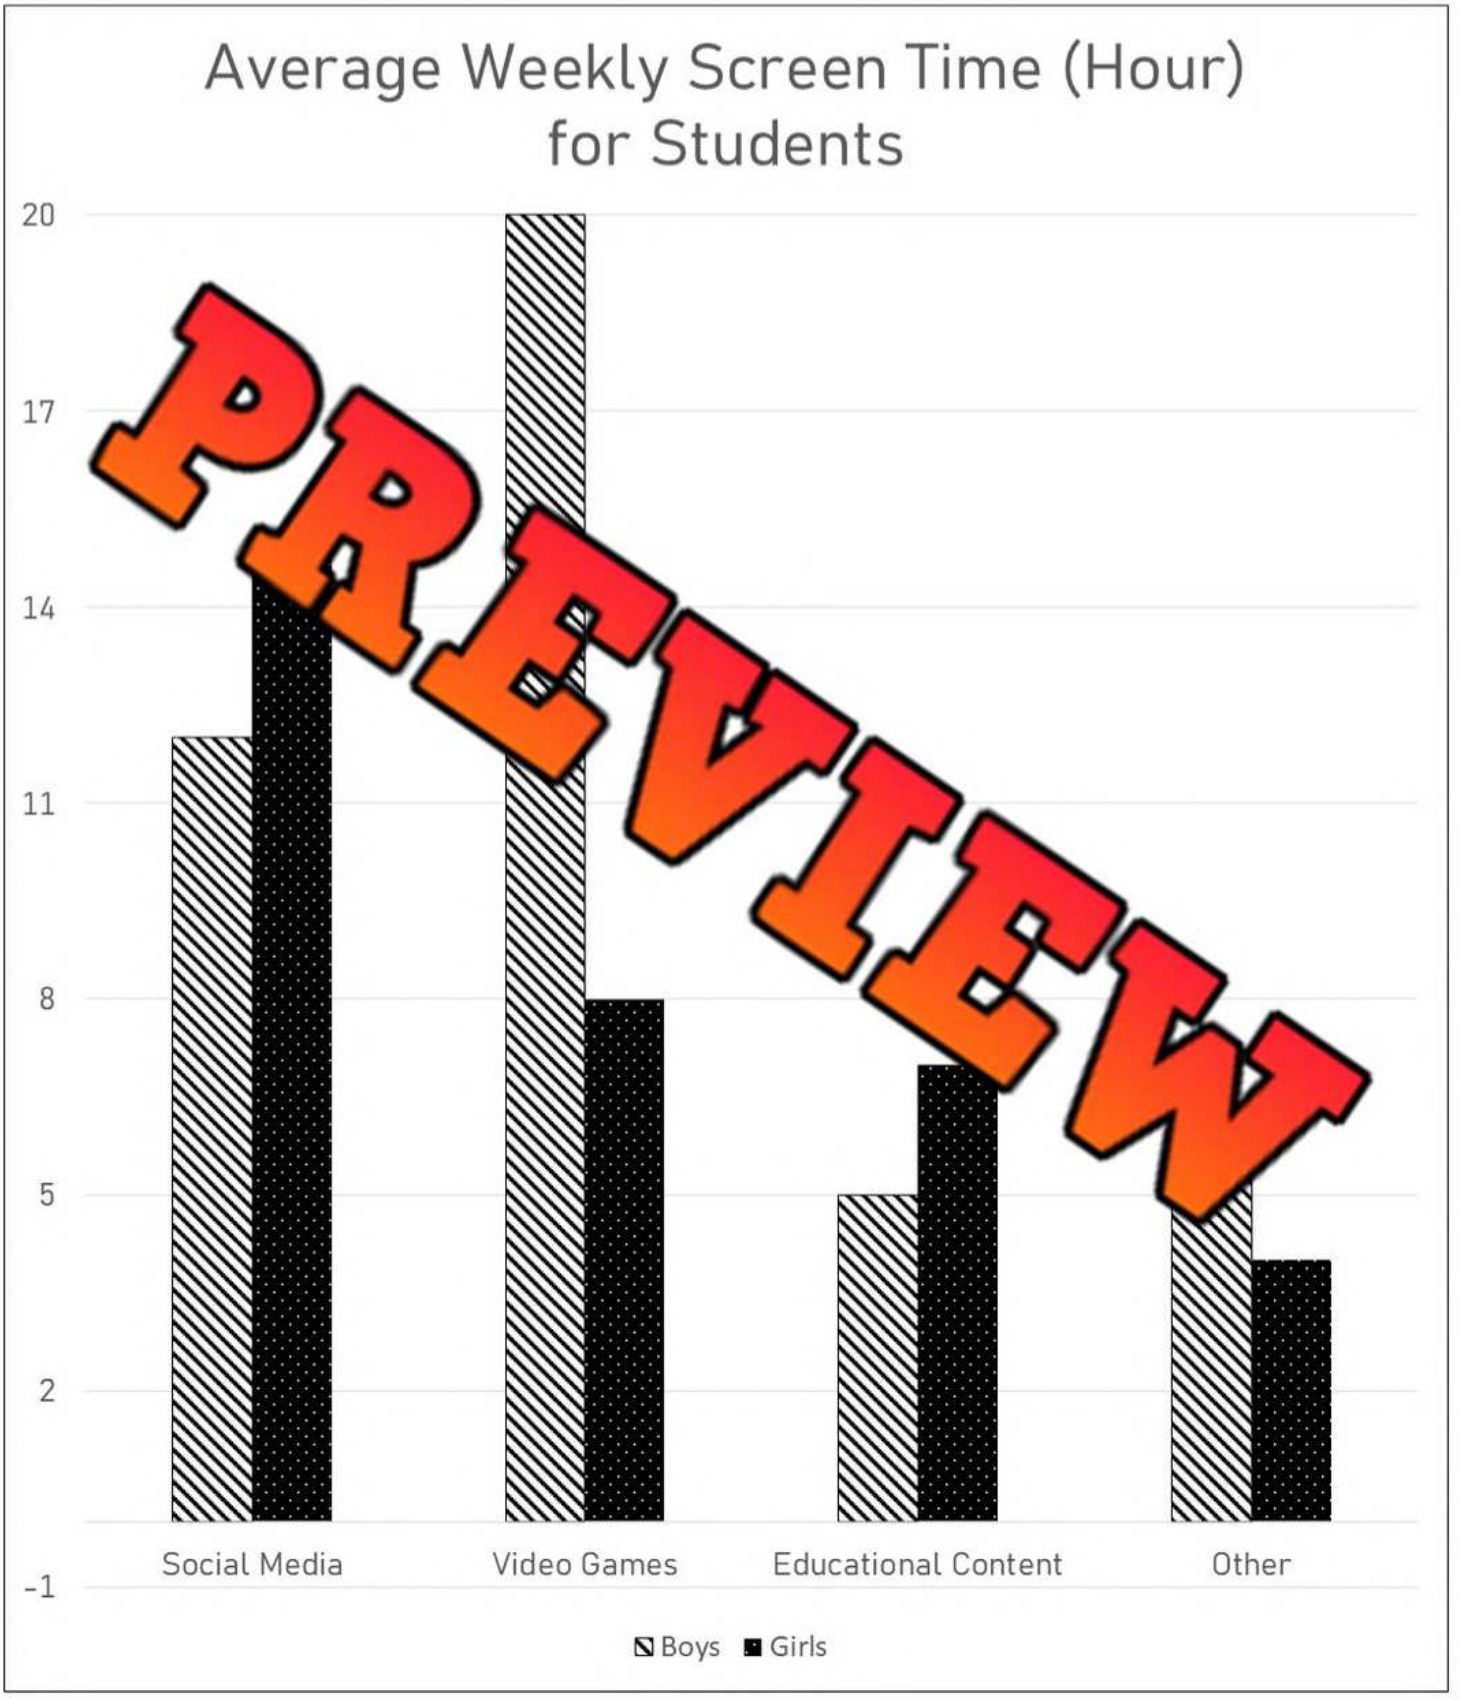

1. Divide the class into small teams, ideally of 5 tude ch.
2. Prepare a series of bar graphs to display c smart d, with corresponding question cards that ask about t gr
3. One team at a time comes to the front where the gr play
4. Display the first bar graph on the smartboard.
5. The first student from the active team reads the graph and sel card. Start the timer when the question is first shown.
6. The student answers the question based on the data presented in the graph. The teacher checks the answer.
7. If the student answers correctly, they flip their bottle or cup repeatedly until they land it upright. When they do, the next teammate can take their turn.
8. If the student's answer is incorrect, they must try another question card before they can attempt to flip.
9. The team's turn ends either when all members have successfully flipped their bottle/cup or when the timer reaches a set limit (e.g., 3 minutes).
10. Record the team's time or number of successful flips on the scoreboard.
11. Repeat steps 4-10 for each team. The team with the fastest time wins.

Truth or Lie? Graph Edition

Objective

What are we learning about?

Students will learn to identify and explain misleading elements in graphs, developing critical thinking skills and understanding how data can be manipulated in visual representations.

PREVIEW

Materials

What you will need for the activity.

- A se print graphs (some accurate, some misleadin
- Smartboard ctor t he graphs
- Classroom spac stu view the graphs

Instructions

How you wi mpl

1. Begin by explaining the concept of misleadin hs t dents, highlighting common ways graphs can be manipulated hangi mitting data, exaggerating differences).
2. Show each graph one at a time on the smartboard tor. M re all students can see the graph clearly.
3. After showing each graph, ask the students to use finger signal decision. They show one finger if they believe the graph is true (cu not misleading) and they show two fingers if they believe the graph is a isleading in some way).
4. Once all students have made their decisions, invite a few students or groups to explain their reasoning. Ask them to point out specific elements of the graph that make it true or misleading, such as the use of a misleading scale or omitted data.
5. Facilitate a class discussion to reinforce key concepts, summarizing the points made by the students and providing additional examples if necessary.
6. Repeat steps 3-6 for each graph in the set. Encourage students to look for new elements that might be misleading as they view different graphs.
7. After all graphs have been discussed, ask the students to reflect on what they have learned. Provide them with questions to think about or answer in their math journals.

Independent Events Versus Dependent Events

In probability, **independent events** don't affect each other. What happens in one event doesn't change the chances of the next.

Example: Flipping a coin and rolling a die – the coin doesn't affect the die.

Dependent events do affect each other. The outcome of the first event changes the chances of the next.

Example: Drawing two cards without putting the first one back – the first card changes what's left in the deck.

Question Is this scenario an independent or dependent event?

#	Scenario	Independent	Dependent
1	Rolling a die and flipping a coin	Independent	Dependent
2	Drawing one card from a deck, then rolling a die	Independent	Dependent
3	Raining today and tomorrow	Independent	Dependent
4	Performing 2 spins on a wheel and getting 5 points both times	Independent	Dependent
5	Tossing a coin and choosing a number between 1 and 10	Independent	Dependent
6	Choosing teams without putting students back in the pool	Independent	Dependent
7	You and your friend pick prizes from a prize bin of different prizes.	Independent	Dependent
8	Drawing names for prizes where each name is only drawn once	Independent	Dependent
9	Getting five fastballs thrown to you in a row	Independent	Dependent
10	Winning the lottery today and next month	Independent	Dependent

Write Write your own example of an independent and dependent event

Tree Diagrams – Dependent & Independent Events

Questions | Answer the questions below

Below are two tree diagrams that represent chocolate (c), oatmeal (o), and raisin (r) cookies being taken out of a cookie jar. One of the diagrams represents independent events, with the cookies being returned to the cookie jar. The other diagram represents dependent events, with the cookies being eaten after they are pulled from the jar.

PREVIEW

1) How are the tree diagrams the same?

2) How are the tree diagrams the different?

Solving Independent Events

How to Solve Independent Events
Independent events are events where the outcome of one event **does not affect** the outcome of the other.

To find the probability of two independe[nt] events both happenin[g] **multiply** the probabili[ty] [of] [the] first event by the probab[ility] [of] [the] second event.

Example:
You flip a coin and roll a die. What is the probability of getting heads and rolling a 4?

Probability of getting heads = 1 out of 2 $(\frac{1}{2})$

Probability of rolling a 4 = 1 out of 6 $(\frac{1}{6})$

P(Heads and 4) = $\frac{1}{2} \times \frac{1}{6} = \frac{1}{12}$

So, there is a 1 in 12 chance of flipping heads and rolling a 4.

D2.2

Theoretical vs Experimental Probability - # of Events

The theoretical and experimental probability of an event happening is not guaranteed to be the same. Performing more trials in an experiment will cause the experimental probability to be closer to the theoretical probability.

Example – if you flip a coin 2 times, it is easy to picture getting heads twice in a row. That would mean the experimental probability of getting a heads was 100% or 2/2. However, if you flipped the coin 100 times, it is almost impossible to get 100 heads in a row.

Part 1

How many times should you get a 1, 2, 3, 4, 5, or 6 when performing the number of rolls below?

	1	2	3	4	5	6	Probability
6 rolls							
12 rolls							
60 rolls							
600 rolls							
1200 rolls							

Part 2

Follow the instructions below to complete the experiments

1) Roll the dice 6 times. Tally your results

1	2			5	6

2) Roll the dice 60 times. Record how many of each number you get.

	1	2	3	4	5	6
Tallies						
Total						

3) Did the experimental probability get closer to the theoretical probability when you rolled the dice more times? Explain why this happens.

Theoretical vs Experimental - Dice

Part 1 What is the theoretical probability of the dependent events below?

	Scenario – What is the probability of...	Probability (Fraction)	Probability (Percent)
1)	Rolling a 1 and then a 2 using a 6-sided dice		
2)	Rolling a 3 and then a 4 using a 6-sided dice		
3)	Rolling a 1, 2, and then a 3 using a 6-sided dice		
4)	Rolling a [illegible] using a 6-sided dice		
5)	Rolling a 1 three times in a row using a 6-sided dice		

PREVIEW

Part 2 Follow the instructions below to complete the experiments

1) The theoretical probability of rolling two 6's in a row is 1/36 or 2.7 percent. Try this experiment for yourself by filling in the table below.

Steps:

1) Get 2 dice or roll one dice twice
2) Every time you roll, mark 1 tally
3) If you get two sixes in a row, mark a tally under the 6/6 column
4) Complete 36 trials. How many times should you roll double 6?

Number of Rolls - Tally	6/6

2) The theoretical probability of rolling a 1 and then a 2 is 1/36 or 2.7 percent. Complete the same steps as above for the numbers 1 and 2. Can you get more than 1 favourable outcome in 36 rolls?

Number of Rolls - Tally	1/2

Odds In Favour

Understanding Odds in Favour
Odds in favour compare the number of ways an event can happen to the number of ways it cannot happen. These are called **complementary** events because they cover all possible outcomes together.

While pro[illegible]ty tells us the chance of an event ou[illegible]tal, odds are written as a ratio of [illegible]omes to unfavourable one[illegible]

Example:
If you roll two dice, there is 1 way to get a sum of 2 and 35 ways not to.

The odds in favour of rolling a sum of 2 are 1:35 (read as "1 to 35").

This means for every 1 way to roll a 2, there are 35 ways to roll something else.

PREVIEW

Unit Quiz - Probability

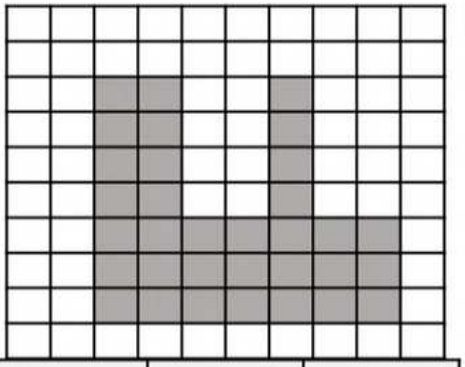

Part 1 Represent the probability of hitting the target using a fraction, decimal and percent

1)

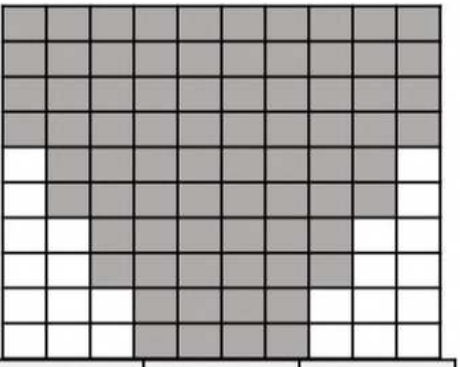

Fraction	Decimal	Percent

2)

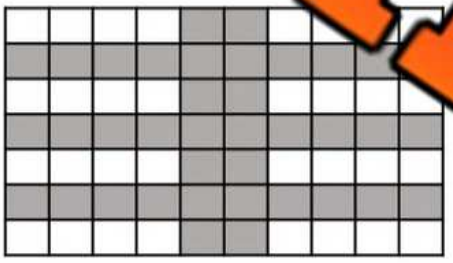

Fraction	Decimal	Percent

3)

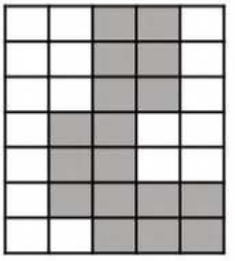

Fraction	Decimal	Percent

4)

Fraction	
Decimal	
Percent	

6)

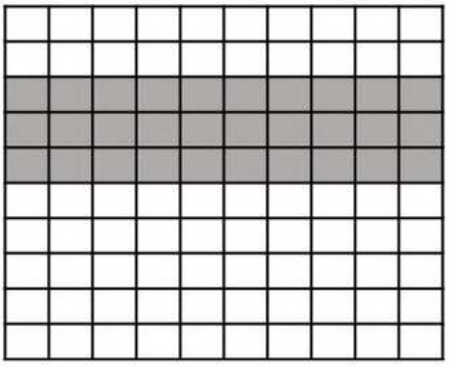

Fraction	
Decimal	
Percent	

PREVIEW

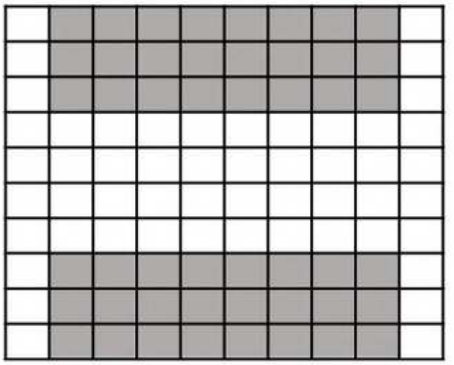

Part 2 What is the probability of hitting the target twice if you get [illegible] rows?

7)

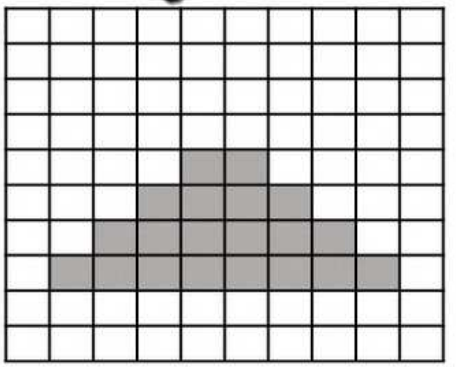

Fraction	Decimal	Percent

8)

Fraction	Decimal	Percent

9)

Fraction	Decimal	Percent

Part 6 Draw a tree diagram to help you find the probability of different combinations

Mitchell has 6 socks in his drawer.

- 2 of the socks are white
- 2 of the socks are black
- 2 of the socks are grey

Mitchell takes out two socks at random at the same time.
What colour socks might he wear today?

1) Draw a tree diagram to represent the scenario above.

PREVIEW

2) How many combinations of coloured socks could he draw? _____

What is the probability taking out...	Fraction	Percent
3) a white sock and then grey sock?		
4) two black socks?		
5) a white and then black sock?
